Batussi
Bahutu

142 the other type has a [9] straight or pug nose, a broader nose tip, and a larger, thicker mouth u(Plate 17b). Both types are conspicuously the oval form of the face, the small but pronounced chin, and the complete absence of Negroid prognathism. Yet, frequently, the noble impression of the face is reduced by the fact that the upper front teeth jut out (buck teeth). For this reason the mouth of these individuals mostly remains half open, and one can see the upper four incisors. These crooked teeth, it seems to me, are especially of frequent occurrence among the members of the most distinguished families, both here and in Ruanda; these people are also tallest. Perhaps these two features are special characteristics and result from the long inbreeding of these families, for they marry only among themselves and are severely restricted in their choice (p. 100-106), while the common Batussi are allowed a wider choice in selecting a mate, and the lowest, poorest class enters into marriages, although not entirely legitimate ones, with the Bahutu as well.

142 If the hair of the head is left unshaven, it is seen to be curly and woolly like that of the Batussi in Ruanda. One also sees at the temples and above the forehead that it does not grow even but in tufts; this is the most Negroid physical feature of the Batussi who, apart from this, do not look like Negroes at all.

142 The second large population group among the Barundi,
149 the Bahutu, who are ruled by the Batussi nobility, have the well-known Bantu physical type, just like all the inhabitants of the interlacustrine area, that is, Ruanda, Mpororó, Ankole, Karagwe, Kiziba, etc. (Plate 6, 8, 9, 10). The differences between them and the Batussi are immediately visible in their short figures, [141] varying between 1.62 and 1.70 meters, and especially in their shorter legs, their thick-set muscular physique which admittedly often looks frail from undernourishment, and in their genuinely prognathous Negroid skull. Somatically they differ very little from the central Bantu of Unjamwesi and Usukuma, although in some respects they resemble the Forest Bantu of the eastern Congo region who formerly probably extended farther toward the east (see p. 152 [not translated]). Their eastern branches
